

KUENEN S.N. 09/724,996

Therefore, according to the present invention, an entirely different support mechanism is provided, which comprises ramp mechanisms that are connected to each other by means of a pull element.

In this way, a sturdy, reliable, and less vulnerable support system is provided, which can be applied to the conveyor belt system in a hot environment.

As there is no obvious way to reach the structure now claimed, by means of either of the applied references or any proper combination thereof, it is believed that the new claims are both patentable and reconsideration and allowance are respectfully requested.

Respectfully submitted,

YOUNG & THOMPSON
